Core Skills

Programming & Web

PHP, JavaScript, Python,
Java, HTML, CSS

Frameworks & Platforms

Laravel, jQuery, SCSS,
React, Node.js, WordPress

Backend Focus

RESTful APIs, third-party
integration, workflow
design, access control,
production support

Databases

MySQL, PostgreSQL, Oracle,
SQL Server

Tools & Delivery

Docker, Docker Compose,
Git, GitHub Actions,
SonarQube, Burp Suite,
Backlog, ProcessMaker, n8n

Automation & AI

n8n workflows, Ollama, local
LLM pipelines, Python
service integration with
Laravel

PROFESSIONAL SUMMARY

Backend engineer focused on stable delivery, integration, and real business workflows

Backend engineer with 5+ years of experience building internal business systems, workflow-driven platforms, and integration services. Core strengths include PHP/Laravel development, API integration, database-centric applications, and translating business requirements into reliable operational flows. I focus on maintainability, delivery stability, and practical problem solving. Outside of work, I build automation and AI-assisted labs to deepen system design and backend architecture skills.

5+ years

Years of experience

Finance, Internal Systems, InsurTech

Domain exposure

API, Data, Workflow

Main delivery focus

EXPERIENCE

Work Experience

Backend Developer

HOPEE Co., Ltd.

02/2024 - Present
Backend Developer

Worked on Japanese client projects covering recruitment, insurance registration, and payment flows, with responsibilities across backend development, database updates, CMS support, third-party integration, code quality review, security checks, and production support.

Kanyuweb

Insurance registration **CMS rebuild** **Payment integration**

- Worked on a Japan-focused insurance registration platform that required business accuracy and user-friendly content flow.
- Modified and improved the web interface based on client requests from Japan.
- Integrated third-party APIs and designed synchronization flows while keeping internal storage lean and maintainable.
- Supported payment gateway migration from e-SCOTT to VeriTrans for the Japanese market, updating request/response flows and transaction result handling based on business requirements.
- Developed and configured a CMS to support the new interface and backend workflow.
- Redesigned parts of the database structure from the legacy project to align with the new CMS-driven system.
- Implemented frontend and backend features using structured design patterns for maintainability and performance.

Education

Duy Tan University

Bachelor of Software Engineering
2017 - 2021
GPA: 3.21 | Class: Good

Language

Vietnamese: Native
English: Basic communication (listening, speaking, reading, and writing)

- Used SonarQube and Burp Suite to maintain code quality and improve security posture.
- Applied AI-assisted tools such as ChatGPT and GitHub Copilot to speed up drafting, refactoring, and documentation while keeping final output aligned with team standards.
- Worked directly with the team backlog and Git-based branch workflow to manage delivery and collaboration.

Team Members: Worked with a team of 5, including 1 Project Lead, 3 Developers, and 1 Translator (Comtor).

Technologies used: PHP, Laravel, JavaScript, jQuery, Node.js, SCSS, MySQL, RESTful APIs (third-party data integration), payment gateway integration (e-SCOTT, VeriTrans), Vite, SonarQube, Burp Suite, Git, Backlog, AI-assisted development tools (ChatGPT, GitHub Copilot)

Mintoku

Recruitment platform Realtime features

- Worked on a recruitment platform connecting job seekers with employers, with focus on backend features and operational stability.
- Developed and integrated realtime chat and notification functionality using Firebase and Pusher.
- Implemented image storage and media handling on AWS S3 for efficient file management.
- Used WordPress where required for related website management and customization tasks.
- Designed and maintained database structures for performance, scalability, and day-to-day production use.
- Provided ongoing support and issue resolution to keep the system stable in production.

Team Members: Worked with a team of 7, including 1 Project Lead (Tester), 5 Developers, and 1 Translator (Comtor).

Technologies used: PHP, Node.js, AWS (S3 for image storage), Firebase, Pusher, WordPress (WP), PostgreSQL, RESTful API

Backend Developer

SHB Finance - Saigon - Hanoi Commercial Joint Stock Bank

07/2021 - 11/2023
Software Development Specialist

Worked on internal finance systems supporting loan origination, customer data, product configuration, staff operations, and insurance processing. Focused on workflow design, API integration, system stability, security, and production support across business-critical internal platforms.

Loan Origination System (LOS)

Core business system High transaction volume Critical workflow

- Analyzed business requirements and designed loan-processing workflows aligned with operational and compliance needs.

- Developed and integrated APIs between LOS and external/internal platforms to support reliable data exchange.
- Optimized backend logic and Oracle queries to keep the system stable under high transaction volume.
- Improved system security through role-based access control, safer authentication flows, and protected data handling.
- Led implementation of a company-critical credit card issuance workflow, including third-party integration, onboarding flow design, and rollout into production.
- Integrated face recognition, CMND/CCCD verification, CIC data, digital signatures, and related services to strengthen fraud prevention and paperless processing.
- Provided troubleshooting, bug fixing, and go-live support for new features and workflow updates.

Team Members: Worked with a team of 4, including a Backend Developer (Java), a Quality Assurance Engineer, and a team leader.

Technologies used: PHP, JavaScript, RESTful API, Oracle, Git, third-party services (Face Recognition, CCCD Verification), digital signatures, CIC integration, RabbitMQ

Customer Data Management System

Project owner **Internal operations**

- Built and maintained a centralized customer data platform supporting internal business operations and control needs.
- Improved usability, resolved critical production issues, and strengthened overall system reliability.
- Implemented multi-level access control and functional updates requested by operations stakeholders.
- Provided real-time production support and troubleshooting for operations teams.

Team Members: Solely responsible for all development and operations.

Technologies used: PHP, Laravel, JavaScript/jQuery, Oracle, JWT, OAuth2, Docker, RESTful API

Products Data Management System

Project owner **Configuration platform**

- Developed a centralized platform for managing product configuration across the loan origination ecosystem.
- Built interfaces that allowed product teams to maintain business parameters such as rates, prices, and required documents.
- Improved search, filtering, version tracking, and validation to reduce manual mistakes and improve auditability.
- Supported recurring quarterly and yearly policy updates in direct coordination with product stakeholders.

Team Members: Solely responsible for all development and operations.

Technologies used: PHP, Laravel, JavaScript/jQuery, MySQL, JWT, OAuth2, Docker, RESTful API

Staff Data Management System

Project owner **Access control**

- Developed and maintained an internal system for managing staff data, permissions, and operational responsibilities.
- Implemented role-management features so business users could create, update, and control staff access effectively.
- Improved user experience and workflow structure for operations teams using the system daily.
- Strengthened security controls, optimized backend behavior, and delivered feature updates based on real user feedback.

Team Members: Solely responsible for all development and operations.

Technologies used: PHP, Laravel, JavaScript/jQuery, Vue.js, Oracle, JWT, OAuth2, Docker, RESTful API

PROJECTS

Personal Projects

OPAS (Online Profit Automation System)

Open-source personal project

Spare-time R&D

System Architect & Full-stack Developer

Personal automation and AI-assisted lab built to sharpen system design, workflow orchestration, and backend delivery skills.

Laravel + n8n Automation Lab

Automation **Local AI**

- Built a personal automation ecosystem that turns experimental workflows into reusable systems for content, data, and business operations.
- Designed orchestration flows with n8n and Python microservices for parsing, enrichment, scheduling, and cross-service processing.
- Integrated local AI runtime with Ollama and multilingual support through LibreTranslate for private automation workflows.
- Containerized the platform with Docker/Compose and maintained CI/CD hygiene with GitHub Actions.
